

ABSTRACT

A method ensures that a set of anonymous peer devices (110) and anonymous policy servers (120) in a system (100) are apprised of all current versions of a policy so that they can quickly implement a version of the policy as it becomes active. The method includes determining whether new versions or a newly active version of a policy exists and generating a message containing the newly received or newly active policy version(s).
5 The method also includes transferring the message to the peer devices (110), the transfer being initiated by either the sender or the receiver.
